

Amendments to the Specification

The paragraph starting at page 30, line 8 and ending at line 14 has been amended as follows.

As the protecting liquid, for example, at least one selected among fatty acid ester such as pentaerythritol, silicon oil, modified silicon and fluorinated oil may be used. Particularly, for pore distribution and pore size of the printing medium, one dispersed and homogenized is preferred, as well as that ~~and~~ entirely covering a presenting region (two-dimensional, three-dimensional) of the printed base material.
